

E-Commerce Delivery Status - Problem Definition

Is this a regression, classification, or clustering problem?

Classification

Is there a target variable?

delivery_status

What is the model expected to learn or predict?

The model predicts the delivery status of an e-commerce order based on the available customer and order features. The possible delivery statuses are On Time, Cancelled, Delayed, or Early.

Write a short problem description in your own words.

The goal is to build a machine learning classification model that can predict the delivery status of e-commerce orders using the available customer and order information.
